

Many targeted cancer medicines cause a variety of unpleasant skin problems that patients can find hard to tolerate, because they are unsightly, itchy and painful. While some of them, such as rash and paronychia, have been well described, there is much less awareness of others. This egrandround offers advice on what to look out for, and how to work as a team to identify different problems, assess which ones the patient finds most bothersome, and take steps to ameliorate them.
